ABSTRACT

Improving the pedagogical system of teaching foreign languages is aimed at developing the student's ability to understand, speak and think in the language. This process combines advanced technologies, motivation and person-oriented approaches. This thesis discusses the development of a model for improving the pedagogical system of teaching foreign languages to students of a higher educational institution and its implementation in practice.

Today, the education system of Uzbekistan is rapidly developing in accordance with international standards. One of the main tasks is to reform the educational process, enrich it with innovative technologies, and develop students' creative thinking skills. Educating the younger generation in the spirit of love and loyalty to the Motherland, national pride, high morality and spirituality, and increasing their intellectual potential are the most pressing issues of today. As a result of the expansion of international cooperation relations and the integration of Uzbekistan into the world economy and cultural space, the demand for specialists with excellent knowledge of foreign languages is increasing. Therefore, the study of foreign languages, in particular English, has become one of the priority areas of state policy. As our President Shavkat Mirziyoyev noted: Another of the most important tasks of the education sector is undoubtedly to educate a new generation, educated young people who have mastered the basics of science and their specialty, who are necessary for today [1: 230]. Therefore, interactive teaching methods, distance learning, and artificial intelligence-based educational platforms are expanding the opportunities for young people to gain knowledge. In particular, new teaching methods are giving effective results in developing students' critical and creative thinking skills. A language teacher is now becoming not only a provider of knowledge, but also a person who manages, guides, and motivates the learning process. The use of multimedia technologies, virtual laboratories, modern textbooks, and electronic resources in the process of language teaching serves to improve the quality of education. One of the most important aspects of teaching foreign languages is the formation of a communicative approach in students. Our main goal is to develop students' speech skills and teach them to communicate in a foreign language in real-life situations.

Artificial intelligence technologies - practical practice of a foreign language through chat bots, translator programs, and voice assistants, and the expansion of language learning opportunities using modern technologies are opening the door to great prospects for the youth of Uzbekistan. Today, modernization and development of the education system is one of the urgent issues. In the education system of the Republic of Uzbekistan, modern pedagogical technologies are being introduced in the process of teaching foreign languages, especially English, and are being raised to a new level of quality. This plays an important role in the formation of the younger generation as a competitive personnel in the international arena. Therefore, the use of new pedagogical technologies in the lesson process serves to increase the efficiency of the educational process. Unlike traditional teaching methods, new technologies have the following advantages:

- Increase the activity of students and teach them to think independently;
- Create a communicative environment in English and help them learn the language faster;

Make the learning process interactive and interesting;

- Help develop skills in using modern information and communication technologies [2: 45].

Pedagogical technologies include a pre-designed and result-oriented approach based on the needs of students. This creates opportunities for teaching, taking into account the individual abilities of each student.

The use of innovative methods in teaching foreign languages brings novelty and a unique atmosphere to the audience. Currently, the following advanced methods are considered effective:

Working in a group - provides students with the opportunity to communicate with each other.

Multimedia tools, interactive textbooks and online platforms during the lesson strengthen the level of students' language proficiency.

The use of modern information and communication technologies allows for more effective foreign language lessons. These include the following:

Multimedia tools (audio and video materials) - increase the effectiveness of language learning through hearing and vision.

Computer and Internet technologies - create wide opportunities for independent learning.

Electronic textbooks and online resources - allow you to use additional sources.

These technologies allow students to communicate in a foreign language, understand texts and develop written speech.

The use of modern pedagogical technologies in teaching foreign languages not only increases the quality of education, but also develops students' independent thinking, problem-solving and communication skills. This helps the younger generation to become internationally competitive specialists [3: 68]. Therefore, teachers need to make extensive use of modern technologies and enrich the teaching process with interactive and innovative methods. Today, one of the main requirements for high professional qualifications is excellent knowledge of foreign languages. It is not for nothing that special attention is paid to the study

of English, which occupies a leading place among the languages of international communication. Teaching English in the education system of the Republic of Uzbekistan is carried out on the basis of a scientific approach, in accordance with the requirements of the time. The introduction of advanced technologies and innovative mechanisms in the process of teaching foreign languages is of great importance. Ensuring that teaching methods meet modern requirements is one of the main tasks of teachers. Development and progress can be achieved not only by using traditional methods in teaching foreign languages, but also by using new pedagogical ideas and innovative technologies.

Advanced technologies reflect a person-oriented approach, which allows for an individual approach to each student. As a result, students not only acquire knowledge, skills and abilities, but also have a positive impact on their personal development.

The integration of modern technologies into the educational process increases the level of teaching foreign languages. In particular, the use of electronic resources, multimedia tools and online educational platforms is required to form reading, communication and written speech skills in English [4: 25].

Therefore, the development of modern teaching technologies, improvement of professional programs and development of scientific research in the higher education system remain one of the important directions for the study of foreign languages.

Information and communication technologies play an important role in the processes of reading professional literature, writing scientific theses, and exchanging written information in order to develop communication, speech comprehension, reading, and writing skills in English. In particular, the wide use of Internet technologies and digital resources in a modern educational environment is of great importance for students. The use of modern technologies in the process of language learning also serves to increase the competitiveness of students and young professionals and expand opportunities for international cooperation. In today's globalization environment, excellent knowledge of foreign languages, especially English, is one of the important conditions for every talented young person to become an accomplished specialist in their field. Therefore, the development of advanced methods of teaching foreign languages based on the National Personnel Training Program and their introduction into the educational process is one of the urgent issues facing scientists and specialists.

The use of modern information and communication technologies serves to make the language learning process effective, convenient, and interactive. Therefore, it is necessary to focus on innovative methods of teaching foreign languages when training a new generation of specialists.

Today, all educational, scientific, cultural and educational institutions in our country are equipped with educational portals and internet systems. This makes it possible to use distance learning methods and expand information and communication services for students.

In conclusion, the education system of the Republic of Uzbekistan is aimed not only at training young specialists with broad knowledge and professional skills, but also at expanding their opportunities for effective communication with peers in foreign countries, keeping abreast of global changes, and using the world's vast intellectual wealth. In-depth study of foreign languages is of particular importance in this..
